- Geometría
 - Esferas mejoradas
 - Cinemática
 - Cálculo de sombras
- Definición del universo
- Sonido
- Código
- Animaciones

Amiga Juggler

Motivación

- No se usan paquetes novedosos (2004)
- Animar escenas 3D no es un punto fuerte de R
- Codificar la cinemática es ineficiente

Entonces... por qué **Amiga JuggleR**?

- Practicar con R
- Reto matemático
- Homenaje al Amiga

Paquetes usados

– **rgl**: “3D Visualization Using OpenGL”

Provides medium to high level functions for 3D interactive graphics, including functions modelled on base graphics (`plot3d()`, etc.) as well as functions for constructing representations of geometric objects (`cube3d()`, etc.). Output may be on screen using OpenGL, or to various standard 3D file formats including WebGL, PLY, OBJ, STL as well as 2D image formats, including PNG, Postscript, SVG, PGF.

Dibujar objetos 3D en perspectiva cónica (esferas, cuadrados y elipses)

– **tuneR**: “Analysis of Music and Speech”

Analyze music and speech, extract features like MFCCs, handle wave files and their representation in various ways, read mp3, read midi, perform steps of a transcription, ... Also contains functions ported from the 'rastamat' 'Matlab' package.

Leer y guardar archivos .WAV

Geometría. Esferas mejoradas

```
spheres3d.plus=function(x=0, y=0, z=0, radius=1, n=101, ...){  
  f=function(s, t) cbind(radius*cos(t)*cos(s) + x,  
                           radius*      sin(s) + y,  
                           radius*sin(t)*cos(s) + z)  
  persp3d(f, slim=c(-pi/2, pi/2), tlim=c(0, 2*pi), n=n, add=T, ...)  
}
```

Geometría. Cinemática tronco

(1/3) TRONCO JUGGLER

$$\sin \beta = \frac{c}{R} \quad // \quad c = R \cdot \sin \beta \leq 0$$

$$\cos \beta = \frac{b}{R} \quad // \quad b = R \cdot \cos \beta \leq 0$$

$$L^2 = a^2 + c^2 \quad // \quad a = \sqrt{L^2 - c^2} \geq 0$$

$$h = L + R - a - b$$

Sistema ortogonal:

$$\begin{cases} \hat{u} = \cos \alpha \cdot \hat{x} - \sin \alpha \cdot \hat{y} \\ \hat{v} = \sin \alpha \cdot \hat{x} + \cos \alpha \cdot \hat{y} \end{cases} \quad \begin{cases} \sin \alpha = \frac{c}{L} \leq 0 \\ \cos \alpha = \frac{a}{L} \geq 0 \end{cases}$$

$$\vec{P} = h \cdot \hat{y} + (L + l) \cdot \hat{v} + d \cdot \hat{u} =$$

$$= h \cdot \hat{y} + (L + l) \cdot \sin \alpha \cdot \hat{x} + (L + l) \cdot \cos \alpha \cdot \hat{y} + d \cdot \cos \alpha \cdot \hat{x} - d \cdot \sin \alpha \cdot \hat{y}$$

$$x = \frac{(L + l) \cdot c}{L} + \frac{d \cdot a}{L} = \frac{(L + l) \cdot c + d \cdot a}{L}$$

$$y = h + \frac{(L + l) \cdot a}{L} - \frac{d \cdot c}{L} = h + \frac{(L + l) \cdot a - d \cdot c}{L}$$

Geometría. Cinemática piernas

(2/3) PIERNAS JUGGLER

$$\left. \begin{aligned} H &= a + b \parallel b = H - a \\ L^2 &= b^2 + c^2 \\ \ell^2 &= a^2 + c^2 \end{aligned} \right\} \begin{aligned} L^2 - \ell^2 &= b^2 - a^2 \\ 2Ha &= H^2 - L^2 + \ell^2 \end{aligned} \parallel \begin{aligned} a &= \frac{H^2 - L^2 + \ell^2}{2H} \end{aligned}$$

Por simetría:

$$b = \frac{H^2 - \ell^2 + L^2}{2H}$$

$$c = \sqrt{L^2 - b^2} = \sqrt{\ell^2 - a^2}$$

Sistema ortonormal:

$$\left. \begin{aligned} \hat{u} &= \cos \alpha \cdot \hat{x} + \sin \alpha \cdot \hat{y} \\ \hat{v} &= -\sin \alpha \cdot \hat{x} + \cos \alpha \cdot \hat{y} \end{aligned} \right\} \begin{aligned} \sin \alpha &= \frac{d}{H} \\ \cos \alpha &= \frac{h}{H} \end{aligned}$$

$$\bar{P} = d \cdot \hat{x} + a \cdot \hat{v} + c \cdot \hat{u} = d \cdot \hat{x} - a \cdot \sin \alpha \cdot \hat{x} + a \cdot \cos \alpha \cdot \hat{y} + c \cdot \cos \alpha \cdot \hat{x} + c \cdot \sin \alpha \cdot \hat{y}$$

$$x = d - a \cdot \sin \alpha + c \cdot \cos \alpha = d - \frac{ad}{H} + \frac{ch}{H} = d - \frac{ad - ch}{H}$$

$$y = a \cdot \cos \alpha + c \cdot \sin \alpha = \frac{ah}{H} + \frac{cd}{H} = \frac{ah + cd}{H}$$

Geometría. Cinemática malabares

Geometría. Cálculo de sombras

(3/3) PROYECCIÓN SOMBRAS

1) Por posición de iluminación:

$$L \equiv (X_b, Y_b, z_b) + \lambda \cdot \underbrace{(X_{LP} - X_b, Y_{LP} - Y_b, z_{LP} - z_b)}_{\text{vector director}}$$

$$\left. \begin{aligned} x &= X_b + \lambda \cdot (X_{LP} - X_b) \\ y &= Y_b + \lambda \cdot (Y_{LP} - Y_b) \\ z &= z_b + \lambda \cdot (z_{LP} - z_b) \end{aligned} \right\} \begin{array}{l} \text{Ec.} \\ \text{paramétrica} \\ \text{recta} \end{array}$$

$$? \bar{P}(X_s, Y_s) = f(X_{LP}, Y_{LP}, z_{LP}, X_b, Y_b, z_b)$$

$$z_s = 0 \parallel z_b + \lambda_s \cdot (z_{LP} - z_b) = 0 \parallel$$

$$\lambda_s = \frac{z_b}{z_b - z_{LP}}$$

$$X_s = X_b + \lambda_s \cdot (X_{LP} - X_b)$$

$$Y_s = Y_b + \lambda_s \cdot (Y_{LP} - Y_b)$$

2) Por dirección de iluminación (fuente de luz en el ∞):

$$L \equiv (X_b, Y_b, z_b) + \lambda \cdot \underbrace{(X_{LD}, Y_{LD}, z_{LD})}_{\text{vector director}} \quad \left. \begin{aligned} x &= X_b + \lambda \cdot X_{LD} \\ y &= Y_b + \lambda \cdot Y_{LD} \\ z &= z_b + \lambda \cdot z_{LD} \end{aligned} \right\} \begin{array}{l} \text{Ec.} \\ \text{paramétrica} \\ \text{recta} \end{array}$$

$$? \bar{P}(X_s, Y_s) = f(X_{LD}, Y_{LD}, z_{LD}, X_b, Y_b, z_b)$$

$$z_s = 0 \parallel z_b + \lambda_s z_{LD} = 0 \parallel \lambda_s = -\frac{z_b}{z_{LD}}$$

$$X_s = X_b + \lambda_s \cdot X_{LD}$$

$$Y_s = Y_b + \lambda_s \cdot Y_{LD}$$

Elongación elíptica:

$$? R' = f(R, X_{LD}, Y_{LD}, z_{LD})$$

$$\text{sen } d = \frac{R}{R'} = \frac{z_{LD}}{\sqrt{X_{LD}^2 + Y_{LD}^2 + z_{LD}^2}} \parallel$$

$$R' = R \cdot \frac{\sqrt{X_{LD}^2 + Y_{LD}^2 + z_{LD}^2}}{z_{LD}}$$

Definición del universo

x, y, z: posición

radius: radio

colour: color

alpha: transparencia

ninterp: esferas a interpolar

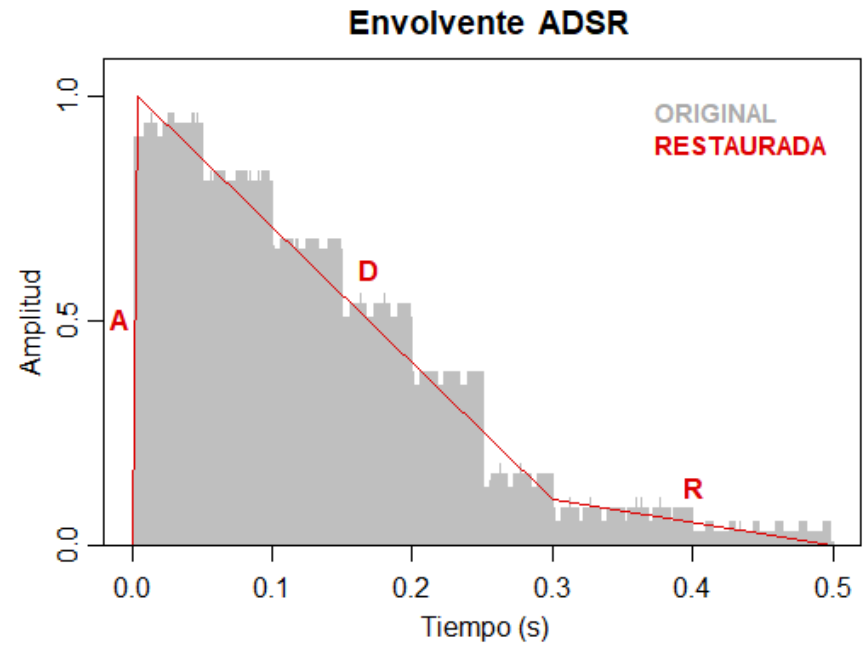

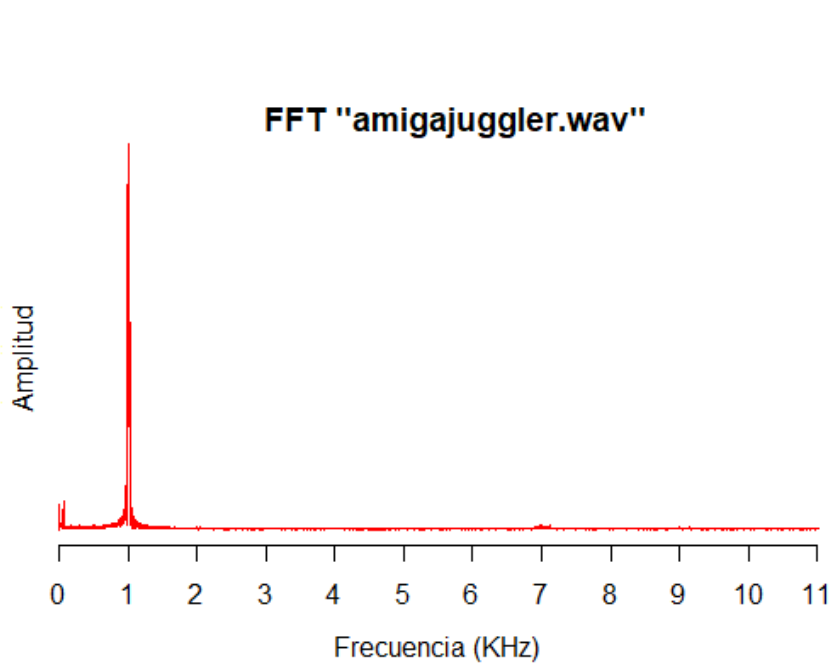

desc: descripción
